

Mes siūlome aukštos kokybės neoriginalius žibintų plovimo sistemos purkštukus ir jų priedus

Pačios apiplovimo sistemos yra pakankamai primityvios ir veikia labai paprastu būdu: tiesiog iš langų apiplovimo skysčio talpos (arba atskiros) siurblio pagalba apiplovimo skystis yra užpurškiamas taip pat kaip ant priekinio lango, jį valant valytuvais ir automatine plovimo sistema. Kalbant apie žibintų apiplovimą reiktų apiplovimo sistemas suskirstyti į du tipus:

*žemo slėgio – purkštukai yra sumontuoti prieš pat žibintus ir aktyvavus valymo funkciją apipurškia žibintų stiklą plovimo skysčiu;

*aukšto slėgio – purkštukai yra paslėpti priekiniame buferyje priešais žibintus. Aktyvavus valymo funkciją, siurblys sukuria pakankamai aukštą slėgį apiplovimo skysčio padavimo į purkštukus vamzdelyje, kuris specialiai sukonstruotas taip, kad veikiamas slėgio išstumtų purkštuką į išorę tam momentui, kai yra atliekama valymo funkcija
